

How are the telecom optical modules

Overview

Optical modules, also known as optical transceivers, are essential components that convert electrical signals to optical signals and vice versa. They form the backbone of long-distance, high-capacity data transport in modern telecom networks. Deployed across fronthaul, midhaul, and backhaul. Integrated circuits and reference designs help you create a smaller and faster optical module design used in high-bandwidth data communication applications. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. That is, metal medium communication represented by coaxial cables and network cables is gradually being replaced by optical fiber media. Among various optical module form factors, SFP (Small Form-Factor Pluggable).
