

How to handle the neutral wire in a distribution box

Overview

In the main panel, neutral/ground buses must be connected together, usually by a wire or metal bar called the main bonding jumper. It is the critical interface where the utility's power is divided into individual branch circuits that feed the lights, outlets, and appliances. The neutral or white wire is usually connected to the breaker box's neutral bus bar. Though a breaker box wiring neutral or ground is connected. The installation of the neutral wire in the distribution box is a crucial part of the electrical system, which is related to electrical safety and system stability. Your breaker box wiring includes three main wire types: black hot wires carry electricity to outlets, white neutral wires return unused power, and green ground wires prevent electrocution.
