

Linux module for checking optical decay

Overview

Then launch `dvdisaster`, either by selecting it in the Desktop Environment icons or by keyboard shortcuts: `$ ALT+F2` Then type: `$ dvdisaster` Then press Enter. When `dvdisaster` will open it's GUI (graphical user interface) you'll have various options to choose. This covers CD, DVD, Blu-rays and M-discs. This guide is only useful for checking if your optical storage has errors, it does not cover how to recover, or create extra redundancy for your data. Then. `ethtool` is used to query and control network device driver and hardware settings, particularly for wired Ethernet devices. `ethtool` with a single argument specifying the device name prints current settings of the specified. For optical modules used on switches, we read their information via brand-specific terminal commands. Manage them dynamically to load or unload features as required.
