

Requirements for the main cable length of communication optical cables

Overview

Copper cabling designed into a network is allowed 100 meters total length, comprised of 90m of permanently installed cable (the "permanent link") and up to 10m of patchcords used to interconnect cabling or connect active networking equipment. Fiber optic cable transmission distance is determined by two primary physical factors that affect signal quality as light travels through the fiber medium. The greater the distance, the greater. In the design of any network—whether a home Wi-Fi setup, an office backbone, or a global telecom infrastructure—the maximum length of network cables is a make-or-break factor. Exceeding a cable's length limit leads to signal attenuation (loss), reduced bandwidth, and unreliable connectivity. Range tells you how much ground you can cover before needing tools like optic cable extender devices or extra cables. We advise you to incorporate a safety buffer when ordering.
