

Should we use fiber optic cable or fiber optic cable for a 500-meter stretch

Overview

Singlemode fiber optic cables are best suited for high bandwidth and long-distance applications, while multimode is used for shorter cable runs, typically under 550 meters. These two types require different electronic equipment. As data demands continue to increase exponentially, the choices you make today regarding your network infrastructure will have a direct impact. Fiber optic cables can be custom cut by Proterial Cable America or distributor to match your required lengths for each cable run. Alternatively, you can order a reel matching the total length needed and cut your own segments as necessary. We advise you to incorporate a safety buffer when ordering. This guide dives deep into the maximum length constraints of the three most common network cables—Ethernet, coaxial, and fiber optic—explaining why these limits exist, how they vary by cable type, and how to extend them when needed. Understanding the role each plays in the system is essential to ensuring successful installation and operation.
