In modern fiber-optic networks, SFP modules (Small Form-factor Pluggable transceivers) are widely used to connect switches, routers, and servers to fiber or copper cabling. These compact, hot-pluggable optical transceivers allow network engineers to flexibly select different transmission media. If you run fiber or copper uplinks in a small office, home lab, or data closet, SFPs (and SFP+) are the little parts that keep your links alive. Non-certified optical or copper modules cannot ensure transmission reliability and may affect service stability.
