

The Role of Optical Time Domain and Optical Power Meters

Overview

The key difference between an OTDR (Optical Time Domain Reflectometer) and a power meter is their function: an OTDR characterizes an entire fiber optic link to find faults and measure losses, while a power meter measures the optical power at a specific point. Here, we will examine the key differences between OTDRs and OPMs and when to use them. The source power is tested first, and then the light passing through the device is tested. The comparison focuses only on what they carry everything: your WhatsApp messages, stock market trades in Lagos, Netflix shows streaming in Abuja, and even life-saving telemedicine calls between rural doctors and city specialists. But here's the thing—fiber is delicate. A tiny bend, a speck of dust, or a careless technician's misstep. Two common tools used for this purpose are the Optical Time Domain Reflectometer (OTDR) and the optic power meter. In this article, we will.
