

What are some types of fiber optic sensors for image stabilization

Overview

The optical fiber sensors are divided into two categories: thru-beam and reflective. The reflective type, which is a single unit, is available in 3 types: parallel, coaxial, and separate. A fiber optic sensor measures a physical quantity by modulating the intensity, spectrum, phase, or polarization of light traveling through the optical fiber system. It's a device that converts light rays into electronic signals. These sensors stand out for their small size, immunity to electromagnetic interference, and capability to function in. The three primary methods of image stabilization include Optical Image Stabilization (OIS), Digital Image Stabilization, and Sensor-Shift Stabilization, each employing different technologies to counteract motion blur. While image stabilization enhances image quality and reduces the need for. The parts of fiber optic sensors mainly include an optical source like laser diode, laser and LED, optical fiber, sensing element like transducer, optical detector & electronic processing unit like wave analyzer, Optical spectrum analyzer & oscilloscope.
