

Which network port should I plug into the fiber optic switch

Overview

While an RJ45 port is intended for Ethernet connections over twisted-pair cables, which have a limited range (up to 100 meters for standard Gigabit Ethernet), an SFP port can support much longer transmission distances with fiber optic cables – often many kilometers or more depending. While an RJ45 port is intended for Ethernet connections over twisted-pair cables, which have a limited range (up to 100 meters for standard Gigabit Ethernet), an SFP port can support much longer transmission distances with fiber optic cables – often many kilometers or more depending. These ports determine how your devices connect to the network and what kind of cables you'll use. RJ45 ports use copper cables and are the standard for home and small office networks. SFP ports, on the other hand, use fiber optic cables or special transceiver modules, making them perfect for. SFP ports enable Gigabit switches to connect to a variety of fiber and Ethernet cables and extend switching functionality throughout the network. Small form-factor pluggable is a hot-swappable interface used to connect network and storage switches and transfer data. Unlike fixed RJ45 copper ports, SFP ports support both fiber and copper modules, enabling far longer distances, greater flexibility, and improved scalability in enterprise. To connect your fiber optic cable to a router, ensure you have the following: Fiber optic modem (ONT): Most fiber connections require an Optical Network Terminal (ONT), provided by your ISP. Compatible router: Verify that your router supports fiber optic input (look for an SFP or WAN port labeled).
